### PivotTable Elements

The screenshot shows the Microsoft Excel ribbon with the 'PivotTable' tab selected. To the right of the ribbon is the PivotTable Fields pane, which contains a search field, a list of fields (Date, Name, Destination), and four areas for dragging fields: Filters, Columns, Rows, and Values. Below these are the PivotTable Field Areas: Filters, Columns, Rows, and Values.

### PivotTables

Create a PivotTable: Select the data range to be used by the PivotTable. Click the **Insert** tab on the ribbon and click the **PivotTable** button in the Tables group. Verify the range and then click **OK**.

Add Multiple PivotTable Fields: Click a field in the field list and drag it to one of the four PivotTable areas that contains one or more fields.

Filter PivotTables: Click and drag a field from the field list into the Filters area. Click the field's list arrow above the PivotTable and select the value(s) you want to filter.

Group PivotTable Values: Select a cell in the PivotTable that contains a value you want to group by. Click the **Analyze** tab on the ribbon and click the **Group Field** button. Specify how the PivotTable should be grouped and then click **OK**.

Refresh a PivotTable: With the PivotTable selected, click the **Analyze** tab on the ribbon. Click the **Refresh** button in the Data group.

Format a PivotTable: With the PivotTable selected, click the **Design** tab. Then, select the desired formatting options from the PivotTable Options group and the PivotTable Styles group.

### PivotCharts

Create a PivotChart: Click any cell in a PivotTable and click the **Analyze** tab on the ribbon. Click the **PivotChart** button in the Tools group. Select a PivotChart type and click **OK**.

Modify PivotChart Data: Drag fields into and out of the field areas in the task pane.

Refresh a PivotChart: With the PivotChart selected, click the **Analyze** tab on the ribbon. Click the **Refresh** button in the Data group.

Modify PivotChart Elements: With the PivotChart selected, click the **Design** tab on the ribbon. Click the **Add Chart Element** button in the Chart Elements group and select the item(s) you want to add to the chart.

Apply a PivotChart Style: Select the PivotChart and click the **Design** tab on the ribbon. Select a style from the gallery in the Chart Styles group.

Update Chart Type: With the PivotChart selected, click the **Design** tab on the ribbon. Click the **Change Chart Type** button in the Type group. Select a new chart type and click **OK**.

Enable PivotChart Drill Down: Click the **Analyze** tab. Click the **Field Buttons** list arrow in the Show/Hide group and select **Show Expand/Collapse Entire Field Buttons**.

### PivotTable Layout

#### PivotTable Fields Pane

The PivotTable Fields pane controls how data is represented in the PivotTable. Click anywhere in the PivotTable to activate the pane. It includes a Search field, a scrolling list of fields (these are the column headings in the data range used to create the PivotTable), and four areas in which fields are placed. These four areas include:

**Filters:** If a field is placed in the Filters area, a menu appears above the PivotTable. Each unique value from the field is an item in the menu, which can be used to filter PivotTable data.

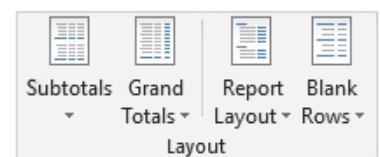

**Column Labels:** The unique values for the fields placed in the Columns area appear as column headings along the top of the PivotTable.

**Row Labels:** The unique values for the fields placed in the Rows area appear as row headings along the left side of the PivotTable.

**Values:** The values are the “meat” of the PivotTable, or the actual data that’s calculated for the fields placed in the rows and/or columns area. Values are most often numeric calculations.

Not all PivotTables will have a field in each area, and sometimes there will be multiple fields in a single area.

#### The Layout Group

**Subtotals:** Show or hide subtotals and specify their location in the PivotTable.

**Grand Totals:** Add or remove grand total rows for columns and/or rows.

**Report Layout:** Adjust the report layout to show in compact, outline, or tabular form.

**Blank Rows:** Emphasize groups of data by manually adding blank rows between grouped items.

## Macros

[Enable the Developer Tab](#): Click the **File** tab and select **Options**. Select **Customize Ribbon** at the left. Check the **Developer** check box and click **OK**.

[Record a Macro](#): Click the **Developer** tab on the ribbon and click the **Record Macro**  button. Type a name and description then specify where to save it. Click **OK**. Complete the steps to be recorded. Click the **Stop Recording**  button on the Developer tab.

[Run a Macro](#): Click the **Developer** tab on the ribbon and click the **Macros**  button. Select the macro and click **Run**.

[Edit a Macro](#): Click the **Developer** tab on the ribbon and click the **Macros**  button. Select a macro and click the **Edit** button. Make the necessary changes to the Visual Basic code and click the **Save** button.

[Delete a Macro](#): Click the **Developer** tab on the ribbon and click the **Macros**  button. Select a macro and click the **Delete** button.

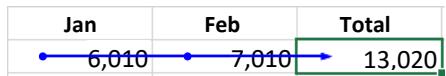

[Macro Security](#): Click the **Developer** tab on the ribbon and click the **Macro Security**  button. Select a security level and click **OK**.

## Troubleshoot Formulas

### Common Formula Errors:

- **#####** - The column isn't wide enough to display all cell data.
- **#NAME?** - The text in the formula isn't recognized.
- **#VALUE!** - There is an error with one or more formula arguments.
- **#DIV/0** - The formula is trying to divide a value by 0.
- **#REF!** - The formula references a cell that no longer exists.

[Trace Precedents](#): Click the cell containing the value you want to trace and click the **Formulas** tab on the ribbon. Click the **Trace Precedents**  button to see which cells affect the value in the selected cell.

[Error Checking](#): Select a cell containing an error. Click the **Formulas** tab on the ribbon and click the **Error Checking**  button in the Formula Auditing group. Use the dialog to locate and fix the error.

[The Watch Window](#): Select the cell you want to watch. Click the **Formulas** tab on the ribbon and click the **Watch Window**  button. Click the **Add Watch**  button. Ensure the correct cell is identified and click **Add**.

[Evaluate a Formula](#): Select a cell with a formula. Click the **Formulas** tab on the ribbon and click the **Evaluate Formula**  button.

## Advanced Formatting

[Customize Conditional Formatting](#): Click the **Conditional Formatting**  button on the Home tab and select **New Rule**. Select a rule type, then edit the styles and values. Click **OK**.

[Edit a Conditional Formatting Rule](#): Click the **Conditional Formatting**  button on the Home tab and select **Manage Rules**. Select the rule you want to edit and click **Edit Rule**. Make your changes to the rule. Click **OK**.

[Change the Order of Conditional Formatting Rules](#): Click the **Conditional Formatting**  button on the Home tab and select **Manage Rules**. Select the rule you want to resequence. Click the **Move Up**  or **Move Down**  arrow until the rule is positioned correctly. Click **OK**.

## Analyze Data

[Goal Seek](#): Click the **Data** tab on the ribbon. Click the **What-If Analysis**  button and select **Goal Seek**. Specify the desired value for the given cell and which cell can be changed to reach the desired result. Click **OK**.

## Advanced Formulas

[Nested Functions](#): A nested function is when one function is tucked inside another function as one of its arguments, like this:

=IF(D2>AVERAGE(B2:B10),1,0)  
 \_\_\_\_\_  
 Initial Function      Nested Function

[IF](#): Performs a logical test to return one value for a true result, and another for a false result.

=IF(B2>69,"True","False")  
 \_\_\_\_\_  
 logical\_test      value\_if\_true      value\_if\_false  
 that can be evaluated as true or false      value to return when the test is true      value to return when the test is false

[AND, OR, NOT](#): Often used with IF to support multiple conditions.

- **AND** requires multiple conditions.
- **OR** accepts several different conditions.
- **NOT** returns the opposite of the condition.

=OR(B5="MN",B5="WI")  
 \_\_\_\_\_  
 logical1      logical2  
 the first condition to evaluate      the second condition to evaluate

[SUMIF and AVERAGEIF](#): Calculates cells that meet a condition.

- **SUMIF** finds the total.
- **AVERAGEIF** finds the average.

=SUMIF(C6:C10,"MN",D6:D10)  
 \_\_\_\_\_  
 range of cells      criteria      calc\_range  
 you want to apply criteria against      determine what cells to sum or calculate, if different than the range

## Advanced Formulas

[VLOOKUP](#): Looks for and retrieves data from a specific column in a table.

=VLOOKUP(D2,A4:E10,5)  
 \_\_\_\_\_  
 value to look up      table from which to retrieve a value      col\_index the column number in the table from which to retrieve a value

[HLOOKUP](#): Looks for and retrieves data from a specific row in a table.

=HLOOKUP(B5,B2:I3,3)  
 \_\_\_\_\_  
 value to look up      table from which to retrieve a value      row\_index the row number in the table from which to retrieve a value

[UPPER, LOWER, and PROPER](#): Changes how text is capitalized.

UPPER Case | lower case | Proper Case

=UPPER(B4)

text to change case or capitalization

[LEFT and RIGHT](#): Extracts a given number of characters from the left or right.

=LEFT(B5,3)

text from which to extract characters      num\_chars to extract from the left or right side of the text

[MID](#): Extracts a given number of characters from the middle of text; the example below would return "day".

=MID("Sunday",4,3)

text from which to extract characters      start\_num location of the first character to extract      num\_chars the number of characters to extract

[MATCH](#): Locates the position of a lookup value in a row or column.

=MATCH("Dog",B2:B10)

lookup\_value to match      lookup\_array range in the lookup\_array of cells

[INDEX](#): Returns a value or the reference to a value from within a range.

=INDEX(A1:B5,2,2)

array a range of cells      row\_num the row position      col\_num the column position (optional)
